# Introduction

This guide provides information about the implementation, authentication and application programming interfaces available to extend OneStream functionality.

OneStream Web API is a RESTful web service designed to expose OneStream Data Automation functions when interacting with third-party API client applications. Our Web API must be installed on a web server and be configured for external authentication providers supporting OAuth2.0/OpenID Connect authorization protocol. Identity Providers currently supported are Okta, Azure AD and PingFederate.

OneStream Web API is API client agnostic. It accepts and outputs data in JSON format making it possible for every API client application that supports this format to also interact with the service.

# REST API Overview

In this topic:

- "OneStream Web API Endpoints" below
- "OneStream REST API Implementation" on page 10
- "Configure OneStream API for External Authentication" on page 28

## OneStream Web API Endpoints

URLs are relative to query parameter api-version=5.3.0, unless otherwise noted.

### Authentication

Authentication endpoint. Represents a RESTful service for Authentication.

- POST api/Authentication/LogonAndReturnCookie

Used primarily by the Enablement Team to verify Web API installation completed successfully. Returns a one-time cookie value that holds authentication state or a message indicating failure along with a proper HTTP code.

### DataManagement

DataManagement endpoint. Represents a RESTful service of Data Management.

- POST api/DataManagement/ExecuteSequence:

Executes a Data Management Sequence and returns a success/failure message along with a proper HTTP code.

- POST api/DataManagement/ExecuteStep

Executes a Data management Step and returns a success/failure message along with a proper HTTP code.

## DataProvider

DataProvider endpoint represents a RESTful service of Data Provider.

- POST api/DataProvider/GetAdoDataSetForAdapter:

Executes a Data Provider HTTP Post request and returns a JSON representation of a DataSet for a given Dashboard Adapter.

- POST api/DataProvider/GetAdoDataSetForCubeViewCommand

Executes a Data Provider HTTP Post request and returns a JSON representation of a DataSet for a given Cube View.

- POST api/DataProvider/GetAdoDataSetForSqlCommand

Executes a Data Provider HTTP Post request and returns a JSON representation of a DataSet for a given Sql query. **Administrator role is required for this functionality.**

- POST api/DataProvider/GetAdoDataSetForMethodCommand

Executes a Data Provider HTTP Post request and returns a JSON representation of a DataSet for a given pre-defined list of method commands. **Administrator role is required for this functionality.**

## Authentication

To secure REST API with OAuth 2.0, configure authentication with one of these supported external providers:

- "Azure AD Configuration" on page 28
- "Okta Configuration" on page 30
- "PingFederate Configuration" on page 36

Access tokens from the any of the above providers have short expiration times. To avoid copying the entire token value to the Authorization/TOKEN text box, create a variable that holds the value. For every call to the external provider, the value of the access token returned will be copied to the variable.

## REST API Overview

---

- Create a global variable in Postman, name it appropriately, for instance webapi\_access\_token.
- In the Tests tab of the POST request to the external provider copy the script below:

```
var data = pm.response.json();
pm.environment.set("webapi_access_token", data.access_token);
```

## Authentication API

Method	Endpoint	Description
Post	Authentication/Logon	Logs on and returns a SessionInfo (SI) object for use with other Rest API calls that accept an SI as an argument. This endpoint performs a logon only and does not open an application. This is the equivalent of entering login credentials in the Desktop App before selecting and opening an application.

### Authentication/Logon

POST https://{BaseWebServer}/api/Authentication/Logon?api-version=7.2.0

#### Query Parameters

Key	Value	Required
api-version	7.2.0	Yes

#### Authorization

Type	Value	Required
Bearer Token	(your access token)	Yes

#### Headers

Key	Value	Required
Content-Type	application/json	Yes

## REST API Overview

---

### Request Body

Key	Type	Description	Required
BaseWebServerURL	string	Your URL for the web service	Yes

### Sample Request

```
{  
    "BaseWebServerUrl": "https://golfstream.onestreamcloud.com/OneStreamWeb"  
}
```

### Sample Response

```
{  
    "Message": "Logon succeeded.",  
    "Logon SessionInfo": {  
        "XfBytes": " QB8AACnodHRwOi8vbG9jYWxob3N0ojUwMDAxL09uZVN0cm  
VhbVd1YhQAAAB7izp1jCP3BUVr8bjD2f6KmmL5BKzhOVWUzU1MikEYOVekO  
ZUIT0tUQV9NMk27tnn6+VZaR544CK1YPCFeWSBWCTmQ2ggAAAAAAAAAAAAA  
AAAAAAAAAAAAAAAFZW4tVVMAAAAAAAAAP//////////////  
//////////////////8P//////////////AwAAABn8//8Z/P//Gfz//xn8//  
8Z/P//Gfz//xn8//8Z/P//Gfz//xn8//8Z/P//Gfz//w==""  
    },  
    "Authorized applications": [  
        "GolfStreamDemo_2022",  
        "OFC_ECA_ProductMgmt",  
        "OneStream_GolfStream"  
    ]  
}
```

## Application API

Method	Endpoint	Description
Post	Application/OpenApplication	Opens specified application. Requires a valid sessionInfo token obtained from the Authentication/Logon method.

### Application/OpenApplication

POST https://{BaseWebServer}/api/Application/OpenApplication?api-version=7.2.0

## REST API Overview

---

### Query Parameters

Key	Value	Required
api-version	7.2.0	Yes

### Authorization

Type	Value	Required
Bearer Token	(your access token)	Yes

### Headers

Key	Value	Required
Content-Type	application/json	Yes

### Request Body

Key	Type	Description	Required
ApplicationName	string	Name of the application to open	Yes
SI	array (bytes)	The SessionInfo (SI) object obtained from Authentication/Logon endpoint.	Yes

### Sample Request

```
{
  "ApplicationName": "GolfStreamDemo_2022",
  "SI": {
    "XfBytes": "QB8AACNodHRwOi8vbG9jYWxob3N0OjUwMDAxL09uZVN0cmVhb

    }  
}
```

## Data Provider API v7.2.0

Method	Endpoint	Description
Post	DataProvider/ GetadoDataSetForAdapter	Executes a Data Provider HTTP Post request and returns a JSON representation of a DataSet for a given Dashboard Adapter. Requires a SessionInfo (SI) object obtained from Application/OpenApplication endpoint.

### DataProvider/GetAdoDataSetForAdapter

POST https://{BaseWebServer}/api/DataProvider/GetAdoDataSetForAdapter?api-version=7.2.0

### Query Parameters

Key	Value	Required
api-version	7.2.0	Yes

## REST API Overview

---

### Authorization

Type	Value	Required
Bearer Token	(your access token)	Yes

### Headers

Key	Value	Required
Content-Type	application/json	Yes

### Request Body

Key	Type	Description	Required
IsSystemLevel	boolean	An indication of whether the Dashboard Adapter is defined at the System Level (True) or for the specified Application (False).	Yes
AdapterName	string	The name of the Dashboard Adapter used for data retrieval.	Yes
ResultDataTableName	string	Name of the resulting table in the DataSet	Yes
CustomSubstVarsAsCommaSeparatedPairs	string	Comma separated list of Variable name/value pairs requiring a user prompt. These must be specified using the following format: "VariableName1=[VariableValue1],VariableName2=[VariableValue2],...".	No
SI	array (bytes)	The SessionInfo (SI) object obtained from Application/OpenApplication endpoint.	Yes

## REST API Overview

---

### Sample Request

```
{  
    "IsSystemLevel": true,  
    "AdapterName": "Sales Mix (WF)",  
    "ResultDataTableName": "ResultsTable",  
    "CustomSubstVarsAsCommaSeparatedPairs": "",  
    "SI": {  
        "XfBytes": " QB8AACNodHRwOi8vbG9jYWxob3N0OjUwMDAxL09uZVN0cm

    }
}
```

# OneStream REST API Implementation

In this topic:

- "Authentication" on page 3
- "OneStream WebAPI Endpoints" below

## OneStream WebAPI Endpoints

This API implementation is client agnostic therefore every API test capable third-party tool can be pointed to OneStreamWeb API endpoints. This tutorial is using Postman. Note that all arguments in the body are **required** unless otherwise specified.

Versioning This implementation will start with Api-version=5.2.0

### Data Management Execute Sequence endpoint

1. Create new POST request in Postman,
2. Url= `http(s)://[servername]:[port]/onestreamapi/api/DataManagement/ExecuteSequence?api-version=5.2.0`
3. Authorization: Type=Bearer Token. Token={{webapi\_access\_token}}
4. Headers: Content-Type=application/json
5. Body (raw / JSON):

```
{  
    "BaseWebServerUrl": [your web server url ],  
    "ApplicationName": [your application name],  
    "SequenceName": [existing sequence name],  
    "CustomSubstVarsAsCommaSeparatedPairs": [comma separated list of key  
value pairs as substitution variables with the following format: "VariableName1=  
[VariableValue1],VariableName2=[VariableValue2],..."] - Optional  
}
```

6. Click Send and observe the response at the bottom pane. If successful, a message of "Data Management Sequence [sequence name] was completed" will be returned otherwise a descriptive error message will show. More details will be logged in the Error and Activity logs.

## Data Management Execute Step endpoint

1. Create new POST request in Postman,
2. Url= http(s)://[servername]:  
[port]/onestreamapi/api/DataManagement/ExecuteStep?api-version=5.2.0
3. Authorization: Type=Bearer Token. Token={{webapi\_access\_token}}
4. Headers: Content-Type=application/json
5. Body (raw / JSON):

```
{  
    "BaseWebServerUrl": [your web server url ],  
    "ApplicationName": [your application name],  
    "DataManagementGroupName": [an existing data management group name],  
    "StepName": [existing step name],  
    "CustomSubstVarsAsCommaSeparatedPairs": [comma separated list of key value pairs as  
substitution variables with the following format: "VariableName1=[VariableValue1],VariableName2=  
[VariableValue2],..."] - Optional  
}
```

## REST API Overview

---

6. Click Send and observe the response at the bottom pane. If successful, a message of "Data Management Step [step name] was completed" will be returned otherwise a descriptive error message will show. More details will be logged in the Error and Activity logs.

The screenshot shows the Postman application interface. A POST request is being prepared to the URL `http://w2k12devweb1:50001/OneStreamApi/api/DataManagement/ExecuteStep?api-version=5.2.0`. The 'Authorization' tab is selected, showing 'Bearer Token' as the type and the token value `[[{webapi_access_token}]]` entered. The 'Send' button is visible at the top right of the request panel.

The screenshot shows the Postman application interface. A POST request is being prepared to the URL `http://w2k12devweb1:50001/OneStreamApi/api/DataManagement/ExecuteStep?api-version=5.2.0`. The 'Body' tab is selected, and the 'raw' option is chosen. A JSON payload is defined in the body panel:

```
1: {
2:   "BaseWebServerUrl": "http://w2k12devweb1:50001/OneStreamWeb",
3:   "ApplicationName": "BasicApp",
4:   "DataManagementGroupName": "Automation",
5:   "StepName": "S3_Export_Report",
6:   "CustomSubstVarsAsCommaSeparatedPairs": ""
7: }
```

### Data Provider GetAdoDataSetForAdapter endpoint

1. Create new POST request in Postman,
2. Url= http(s)://[servername]:  
[port]/onestreamapi/api/DataProvider/GetAdoDataSetForAdapter?api-version=5.2.0
3. Authorization: Type=Bearer Token. Token={{webapi\_access\_token}}
4. Headers: Content-Type=application/json
5. Body (raw / JSON):

```
{  
    "BaseWebServerUrl": [your web server url ],  
    "ApplicationName": [your application name],  
    "WorkspaceName": Reserved for future use. Use an empty string. - Optional,  
    "AdapterName": [existing adapter name],  
    "ResultDataTableName": [name of resulting table in the DataSet],  
    "CustomSubstVarsAsCommaSeparatedPairs": [comma separated list of key value pairs as  
    substitution variables with the following format: "VariableName1=[VariableValue1],VariableName2=  
    [VariableValue2],..."] - Optional  
}
```

Example:

```
{  
    "BaseWebServerUrl": "http://localhost:50528/OneStream",  
    "ApplicationName": "GolfStream_v37",  
    "IsSystemLevel": "False",  
    "AdapterName": "ActivityClassListing_PLP",  
    "ResultDataTableName": "ResultsTable",  
    "CustomSubstVarsAsCommaSeparatedPairs": ""  
}
```

6. Click Send and observe the response at the bottom pane. If successful, a JSON data table will be returned otherwise a descriptive error message will show. More details will be logged in the Error and Activity logs.

This is a returned response from the request using the above body example in Postman:

```
{
```

## REST API Overview

---

```
"ResultsTable": [
    {
        "ClassID": "100_Salary",
        "Name": "100 - Salary",
        "Description": "100 - Salary",
        "ValueType": 0,
        "ValueTypeName": "Wage Percentage",
        "ClassItemID": "79b612b9-8cb4-49ca-9a0d-d13c7683a7f2",
        "Description1": "100 - Salary",
        "WeightOrValue": "1",
        "FKAccountID": "Salary_Exp",
        "Flow": "None",
        "IC": "None",
        "UD1": "None",
        "UD2": "None",
        "UD3": "None",
        "UD4": "None",
        "UD5": "None",
        "UD6": "None",
        "UD7": "None",
        "UD8": "None",
        "Sequence": 10.0,
        "FKClassID": "100_Salary"
    },
    ...
]}
```

## Data Provider GetAdoDataSetForCubeViewCommand endpoint

1. Create new POST request in Postman,
2. Url= http(s)://[servername]:[port]/onestreamapi/api/DataProvider/GetAdoDataSetForCubeViewCommand?api-version=5.2.0
3. Authorization: Type=Bearer Token. Token={{webapi\_access\_token}}

## REST API Overview

---

4. Headers: Content-Type=application/json

5. Body (raw / JSON):

```
{  
    "BaseWebServerUrl": [your web server url ],  
    "ApplicationName": [your application name],  
    "CubeViewName": [existing Cube View name],  
    "DataTablePerCubeViewRow": [if true returns a Data Table Per Cube View row - bool],  
    "ResultDataTableName": [name of resulting table in the DataSet],  
    "CubeViewDataTableOptions": [set of formatting boolean options for the returned table -  
    Optional],  
    "CustomSubstVarsAsCommaSeparatedPairs": [comma separated list of key value pairs as  
    substitution variables with the following format: "VariableName1=[VariableValue1],VariableName2=  
    [VariableValue2],..."] - Optional  
}
```

Example:

```
{  
    "BaseWebServerUrl": "http://localhost:50528/OneStream",  
    "ApplicationName": "GolfStream_v37",  
    "CubeViewName": "Gross Margin",  
    "DataTablePerCubeViewRow": false,  
    "ResultDataTableName": "ResultDataTableNames",  
    "CustomSubstVarsAsCommaSeparatedPairs": "",  
    "CubeViewDataTableOptions": {  
        "IncludeTitle": false,  
        "IncludeHeaderLeftLabel1": true,  
        "IncludeHeaderLeftLabel2": true,  
        "IncludeHeaderLeftLabel3": true,  
        "IncludeHeaderLeftLabel4": true,  
        "IncludeHeaderCenterLabel1": true,  
        "IncludeHeaderCenterLabel2": true,  
        "IncludeHeaderCenterLabel3": true,  
        "IncludeHeaderCenterLabel4": true,  
        "IncludeHeaderRightLabel1": true,  
        "IncludeHeaderRightLabel2": true,  
        "IncludeHeaderRightLabel3": true,  
        "IncludeHeaderRightLabel4": true,  
    }  
}
```

## REST API Overview

---

```
        "IncludePovCube" : true,  
        "IncludePovEntity" : true,  
        "IncludePovParent" : true,  
        "IncludePovCons" : true,  
        "IncludePovScenario" : true,  
        "IncludePovTime" : true,  
        "IncludePovView" : true,  
        "IncludePovAccount" : true,  
        "IncludePovFlow" : true,  
        "IncludePovOrigin" : true,  
        "IncludePovIC" : true,  
        "IncludePovUD1" : true,  
        "IncludePovUD2" : true,  
        "IncludePovUD3" : false,  
        "IncludePovUD4" : true,  
        "IncludePovUD5" : false,  
        "IncludePovUD6" : true,  
        "IncludePovUD7" : false,  
        "IncludePovUD8" : true,  
        "IncludeMemberDetails": true,  
        "IncludeRowNavLink" : true,  
        "IncludeHasDataStatus" : true,  
        "IncludeAnnotation" : true,  
        "IncludeAssumptions" : true,  
        "IncludeAuditComment" : true,  
        "IncludeFootnote" : true,  
        "IncludeVarianceExplanation" : true  
    }  
}
```

6. Click Send and observe the response at the bottom pane. If successful, a JSON data table will be returned otherwise a descriptive error message will show. More details will be logged in the Error and Activity logs.

This is a returned response from the request using the above body example in Postman:

```
{  
    "ResultDataTableNames": [  
        {  
            "RowId": 0,  
            "RowName": "Row1",  
            "HeaderLeftLabel1": "",  
            "HeaderLeftLabel2": "",  
            "HeaderLeftLabel3": "",  
            "HeaderLeftLabel4": "",  
            "HeaderCenterLabel1": "",  
            "HeaderCenterLabel2": "",  
            "HeaderCenterLabel3": "",  
            "HeaderCenterLabel4": "",  
            "HeaderRightLabel1": "",  
            "HeaderRightLabel2": "",  
            "HeaderRightLabel3": "",  
            "HeaderRightLabel4": "",  
            "PovCubeId": 5,  
            ...  
            "Col8VarianceExplanation": ""  
        },  
        ...  
    ] } }
```

## Data Provider GetAdoDataSetForSqlCommand endpoint

1. Create new POST request in Postman,
2. Url= http(s)://[servername]:[port]/onestreamapi/api/DataProvider/GetAdoDataSetForSqlCommand?api-version=5.2.0
3. Authorization: Type=Bearer Token. Token={{webapi\_access\_token}}
4. Headers: Content-Type=application/json
5. Body (raw / JSON):

## REST API Overview

---

```
{  
    "BaseWebServerUrl": [your web server url],  
    "ApplicationName": [your application name],  
    "SQLQuery": [sql query statement used to return data],  
    "DbLocation": [specify if data from an external database referenced in the  
configuration will need to be returned - string - defaults to "Application" - Optional],  
    "ResultDataTableName": [name of resulting table in the DataSet],  
    "XFExternalDBConnectionName": [specify if DbLocation is set to "External"],  
    "CustomSubstVarsAsCommaSeparatedPairs": [comma separated list of key  
value pairs as substitution variables with the following format: "VariableName1=  
[VariableValue1],VariableName2=[VariableValue2],..."] - Optional  
}
```

Example:

```
{  
    "BaseWebServerUrl": "http://localhost:50528/OneStream",  
    "ApplicationName": "GolfStream_v37",  
    "SQLQuery": "Select TOP 100 * from Cube",  
    "ResultDataTableName": "ResultDataTableName",  
    "DBLocation": "Application",  
    "XFExternalConnectionName": "",  
    "CustomSubstVarsAsCommaSeparatedPairs": ""  
}
```

6. Click Send and observe the response at the bottom pane. If successful, a JSON data table will be returned otherwise a descriptive error message will show. More details will be logged in the Error and Activity logs.

This is a returned response from the request using the above body example in Postman:

```
{  
    "ResultDataTableName": [  
        {  
            "CubeId": 0,  
            "Name": "Houston",  
            "Description": "Houston Clubs",  
            "City": "Houston",  
            "State": "Texas",  
            "Country": "USA",  
            "Address": "123 Main Street",  
            "ZipCode": "77001",  
            "Phone": "(281) 555-1234",  
            "Email": "info@houstonclubs.com",  
            "Website": "www.houstonclubs.com",  
            "CreatedDate": "2023-01-01T00:00:00",  
            "LastModifiedDate": "2023-01-01T00:00:00",  
            "Deleted": false  
        }  
    ]  
}
```

### Data Provider GetAdoDataSetForMethodCommand endpoint

1. Create new POST request in Postman,
2. Url= http(s)://[servername]:[port]/onestreamapi/api/DataProvider/GetAdoDataSetForMethodCommand?api-version=5.2.0
3. Authorization: Type=Bearer Token. Token={{webapi\_access\_token}}
4. Headers: Content-Type=application/json
5. Body (raw / JSON):

```
{  
    "BaseWebServerUrl": [your web server url ],  
    "ApplicationName": [your application name],  
    "MethodQuery": [method query to return data],  
    "XFCommandMethodTypeId": [pre-defined list of XF method commands used by XFDataProvider to  
    fill a DataSet],  
    "ResultDataTableName": [name of resulting table in the DataSet],  
    "CustomSubstVarsAsCommaSeparatedPairs": [comma separated list of key value pairs as  
    substitution variables with the following format: "VariableName1=[VariableValue1],VariableName2=  
    [VariableValue2],..."] - Optional  
}
```

#### Example:

```
{  
    "BaseWebServerUrl": "http://localhost:50528/OneStream",  
    "ApplicationName": "GolfStream_v37",  
    "MethodQuery": "{Houston}{Actual}{2018M1}{true}{}",  
    "XFCommandMethodTypeId": "CertificationForWorkflowUnit",  
    "ResultDataTableName": "MyResultsTable",  
    "CustomSubstVarsAsCommaSeparatedPairs": ""  
}  
  
XFCommandMethodTypeId may take any values from the list below:  
"WorkflowCalculationEntities"  
"WorkflowConfirmationEntities"  
"WorkflowProfileAndDependentProfileEntities"  
"WorkflowProfileEntities"  
"WorkflowProfiles"
```

## REST API Overview

## Authentication Execute LogonAndReturnCookie endpoint

Returns a one-time cookie value that indicates authentication state. Used mostly by enablement team to verify the installation of web API completed successfully.

1. Create new POST request in Postman,
2. Url= http(s)://[servername]:  
[port]/OneStreamApi/api/Authentication/LogonAndReturnCookie?api-version=5.2.0
3. Authorization: Type=Bearer Token. Token={{webapi\_access\_token}}
4. Headers: Content-Type=application/json
5. Body (raw / JSON):

Arguments:

**"BaseWebServerUrl"**: [your web server url],  
**"ApplicationName"** : [name of Application attempted to access]

```
<response code="200">Returns a JSON representation of the resulting  
DataSet.</response>  
<response code="400">Bad Request. Missing Authentication arguments.  
</response>  
<response code="500">Error Message. Authentication Failed. Please check the  
Error Log for more details</response>
```

Click Send and observe the response at the bottom pane. If successful, a one-time cookie value that indicates authentication state will be returned. Otherwise the error message will be shown. More details will be logged in the Error and Activity logs.

## REST API Overview

---

The screenshot shows the Postman interface for a POST request to `http://localhost:3403/api/Authentication/LogonAndReturnCookie?api-version=5.2.0`. The 'Authorization' tab is selected, showing a 'Bearer Token' type with a placeholder 'Token' containing `{{webapi_access_token}}`. A note about sensitive data security is visible. A 'Preview Request' button is at the bottom.

The screenshot shows the Postman interface for the same POST request. The 'Headers' tab is selected, and the 'Body' section is set to 'raw' with 'JSON (application/json)' selected. The JSON payload is:

```
1 * [{}  
2     "BaseWebServerUrl": "http://localhost:50528/OneStream",  
3     "ApplicationName": "GolfStream_v37"  
4 ]
```

# Configure OneStream API for External Authentication

We support REST API authentication with Azure AD, Okta and PingFederate. Perform the configuration for your provider:

- "PingFederate Configuration" on page 36
- "Okta Configuration" on page 30
- "Azure AD Configuration" below

## Azure AD Configuration

Register an application:

- Sign in to the Azure portal.
- To the left, select the **Azure Active Directory** service, and then **App registrations > New registration**.
- On the **Register an application** page, enter the application's registration name and click Register.
- On the Application's **Overview** tab, note {Client Id}, {Tenant Id}
- On **Authentication > Advanced Settings** select Access and ID tokens.
- In **Default Client Type**, select **Yes** for **Treat application as a public client**.
- In Supported Account types, select **Accounts in this organizational directory only (Default Directory)**.
- Save.
- In **Certificates & secrets**, add **New client secret** and note the value. Save.

## Configure OneStream API for External Authentication

---

- In **Expose an API tab**, add a custom scope needed for user-machine use case.  
Note the scope name and the {AppId Uri} values.
- Save.
- We support v2.0 Azure endpoints, so on **Manifest**, find **accessTokenAcceptedVersion**. Set the value to **2**.

The screenshot shows the Microsoft Azure portal interface for managing an application named "OneStreamWebApi". The left sidebar contains navigation links for Overview, Quickstart, Manage (Branding, Authentication, Certificates & secrets, API permissions, Expose an API), Owners, Roles and administrators, and the current tab, Manifest. The main content area is titled "OneStreamWebApi - Manifest" and contains a code editor with the application's manifest JSON. The "accessTokenAcceptedVersion" field is highlighted in red, indicating it has been modified. The JSON code is as follows:

```
1  {
2      "id": "6df1e70d-f84c-4f4d-8d7b-766685180c1c",
3      "acceptMappedClaims": null,
4      "accessTokenAcceptedVersion": 2,
5      "addIns": [],
6      "allowPublicClient": true,
7      "appId": "c2696c45-e3ec-44bd-b6f1-a1ed4d512c84"
8      "appRoles": [],
9      "oauth2AllowUrlPathMatching": false,
10     "createdDateTime": "2019-07-26T12:48:35Z",
11     "groupMembershipClaims": null,
12     "identifierUris": [
13         "api://c2696c45-e3ec-44bd-b6f1-a1ed4d512c84"
14     ],
15     "informationalUrls": {
16         "termsOfService": null,
17         "support": null,
18         "privacy": null,
19         "marketing": null
20     },
21     "keyCredentials": [],
22     "knownClientApplications": []
}
```

- Save.

# Okta Configuration

## Create M2M Application Registration (`grant_type = client_credentials`)

- Create a new OAuth Service App.
- Add a name, then click **OK**.
- Note the Client ID and Client Secret values. Copy these values.

The screenshot shows the Okta application configuration interface. At the top, there's a navigation bar with a back arrow labeled "Back to Applications", a gear icon, and a pencil icon. The application name is "OneStreamWebApiClientCredentials". Below the name, there are status indicators: "Active" with a dropdown arrow, a green lock icon, and a "View Logs" button. A horizontal bar indicates the "General" tab is selected. The "General Settings" section contains an "Edit" button. Under the "APPLICATION" heading, the "Application label" is set to "OneStreamWebApiClientCredentials". In the "Client Credentials" section, there is an "Edit" button. The "Client ID" field contains the value "OoamI220rqTFFZkca0h7", with a copy icon next to it. A note below the field states: "Public Identifier for the client that is required for all OAuth flows." The "Client secret" field is shown as a series of dots, with a copy icon and an eye icon next to it.

- Perform the tasks in the next section.

## Create U2M Application Registration (**grant\_type = password**) in Okta

- Create a Native App.
- Specify a Label and select the **Allowed Grant Types** shown below.
- Note the Logout Redirect URLs, Client ID, and Client Secret values. Copy these values.
- Select **Use Client Authentication**.

## Configure OneStream API for External Authentication

---

← Back to Applications

OneStreamWebApiUserCreds

Active   View Logs

General Sign On Assignments

---

### General Settings

#### APPLICATION

Application label **OneStreamWebApiUserCreds**

Application type **Native**

Allowed grant types Client acting on behalf of a user

Authorization Code  
 Refresh Token  
 Resource Owner Password  
 Implicit (Hybrid)

---

#### LOGIN

Login redirect URIs  **com.oktapreview.dev-992535/callback**

Logout redirect URIs 

Initiate login URI

## Configure OneStream API for External Authentication

---

Client Credentials

Client ID  Edit

Public identifier for the client that is required for all OAuth flows.

Client authentication

Use PKCE (for public clients)  
Uses Proof Key for Code Exchange (PKCE) instead of a client secret. A one-time key is generated by the client and sent with each request. Instead of proving the identity of a client, this ensures that only the client which requested the token can redeem it.

Use Client Authentication  
Not secure for distributed native apps. A client secret is embedded in the client and is sent with requests, proving the identity of the client.

Client secret  Copy

- Select **API > Authorization servers**.
- Click **Add Authorization Server**, provide a name, and set **Client ID** as the **Audience**.

## Configure OneStream API for External Authentication

---

Add Authorization Server

Name	OneStreamWebApiUserCreds
Audience	Ooaj9gjoukO0aRHPL0h7
Description	

**Save** **Cancel**

The screenshot shows a configuration dialog for adding an authorization server. The 'Name' field is populated with 'OneStreamWebApiUserCreds'. The 'Audience' field is populated with a long string of characters. The 'Description' field is empty. At the bottom right are two buttons: a green 'Save' button and a white 'Cancel' button.

- Click **Save**.
- Add a custom scope to support the Machine-to-Machine scenario. For example:

## Configure OneStream API for External Authentication

---

OneStreamWebApiUserCreds

Active ▾

Help

Settings Scopes Claims Access Policies Token Preview

Name	Description	Default Scope	Metadata Publish	Actions
WebApiMachineToMachineScope	WebApiMachineToMachineScope	No	No	
openid	Signals that a request is an OpenID request.	No	Yes	
profile	Allows this application to access your profile information.	No	Yes	
email	Allows this application to access your email address.	No	Yes	
address	Allows this application to access your address.	No	Yes	
phone	Allows this application to access your phone number.	No	Yes	
offline_access	Allows this application to access your data when you aren't using the application.	No	Yes	

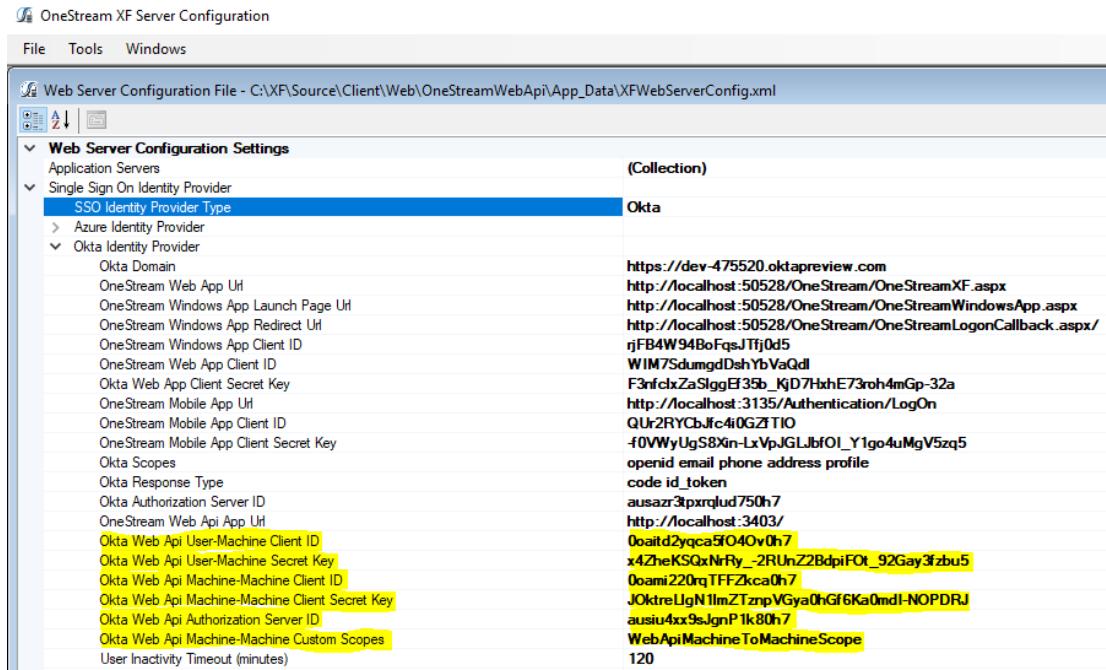

- Perform the tasks in the next section.

## Update the Server Configuration Utility

- Launch the Server Configuration utility and enter the values for the four Web Api properties. For example:

## Configure OneStream API for External Authentication

---

- Save the file.
- Restart IIS.

## PingFederate Configuration

1. Add a new client in PingFederate Admin Console representing the OneStreamWeb Api application.
2. Create a U2M Application Registration (grant\_type = password).
3. Create a new Access Token Manager (ATM) and note the **Access Token Manager ID** value (Client Credentials). See Appendix 9.10 for instructions on how to setup a ATM in Ping Admin console.
4. Set **Client Authentication** to the **Client Secret** option.
5. Click **Generate Secret**, then **Update** and note the Client ID and Client Secret values.

## Configure OneStream API for External Authentication

---

6. In **Allowed Grant Types**, select **Authorization Code, Resource Owner Password Credentials, Client Credentials**.
7. Set **Default Access Token Manager** to the value in step 1.
8. Save.

**Client**  
Manage the configuration and policy information about a client.

## Update the Server Config Utility

1. Launch the Server Configuration utility and enter the values for the four Web API properties.
2. Save.
3. Restart IIS.

## Configure the AUD Value

In some installations, the Audience value is not used in the authentication process. Normal processing will cause authentication to fail if this value is not used. The **Validate Audience** option allows for disabling audience validation for these installations.

By default, this setting is **True**, which means the audience will be validated.

1. In the Web Server Configuration file, select **Single Sign On Identity Provider**.
2. In **PingFederate Identity Provider**, click the ellipsis for more details.

## Configure OneStream API for External Authentication

---

3. In **Validate Audience**, select **False** to disable Audience validation.
